

Sleep Mode

Versions of Sleep mode when room is reserved and open

Contrast/readability issue.

Get rid of "currently" throughout. "This room is available" / "this room is reserved..."

Change to language about texting

What's this calendar icon for?

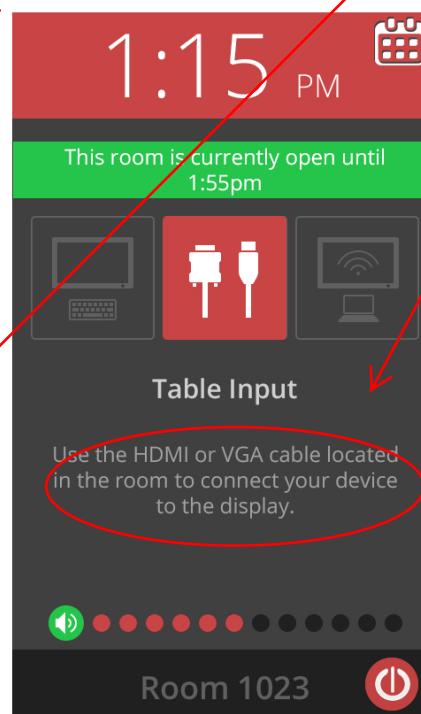

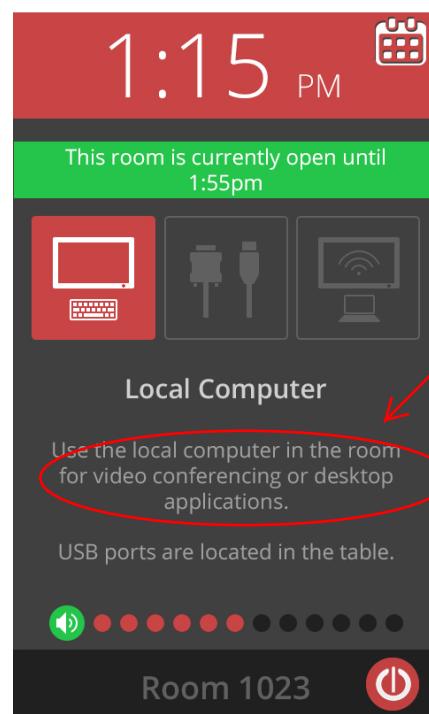

Do people really need to know why you'd use the in-room computer?

Probably more important to say where connectors are rather than what they do.

What does it even mean to connect "up to four laptops" to a wireless display, and would a patron actually use the feature?

Will patrons understand what "browse to xxx.xxx.xxx.xxx" language means in this context?

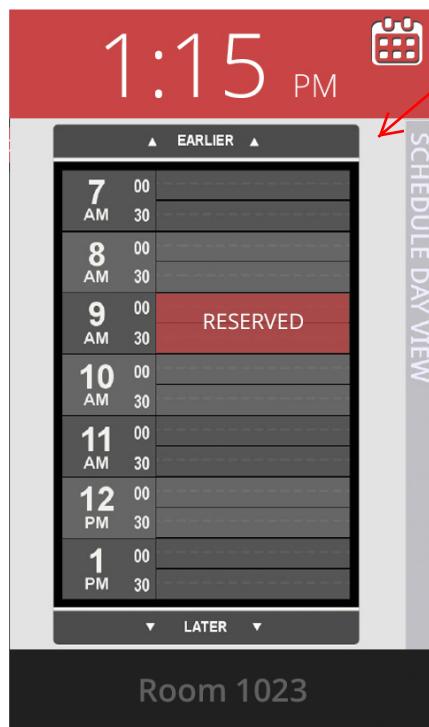

Volume controls are too close to power button.

Sleep mode seems unnecessary. Eliminating it in favor of design that included contact info on the input select view would be better -- fewer states. Also, how does a user get the contact information for Ask Us without powering off the system?

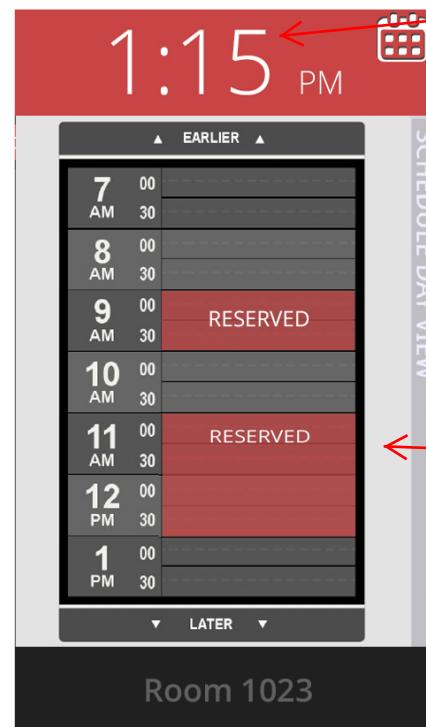

What's the use case for this view?

Will system let user view the past? Different days? What time will the system default to when user first arrives?

Ver. 1
with 1 reservation

Note-
User can swipe up or down on time log to see reservations on that day

Ver. 2
with several Reservations

Should today's date be included in time display?

What does "schedule day view" mean, and is the label useful in this context?

"Reserved" text seems unnecessary if availability display is clear on its own.

When hitting the top left Calendar button you will be taken to the screen above which you can scroll through the times of that day to see if the room is reserved or open. When hitting calendar again it will take you back to whatever page you were on before, which would "sleep mode" or "power on inputs page"

This will not necessarily be obvious to the user.

Will this view return to the sleep mode/inputs view if left idle?
